stereolithography and used in medical technology, are made biocompatible, and therefore also solves the essential problem to be solved by the application. However, document D4 does not contain detailed information on the composition of the mixtures to be used for producing the moulded parts and therefore cannot be prejudicial to the novelty of claims 1 and 2.

4 According to claim 1 only components a), c), e) and f) are obligatory.

Documents D1 to D3 (see in particular the passages cited in the international search report) describe low-viscosity, photo-polymerizable compositions which can contain the components a), c) and e) according to claim 1 and a standard inhibitor; although tetramethylpiperidine-1-yloxy is not explicitly mentioned, it must be considered a standard inhibitor. Since the quantitative composition and the viscosity values specified are not found in documents D1 and D3 in the specified combination, claim 1 and dependent claim 2 are also novel over these documents.

5 Since a combination of documents D1 to D3 would also not prompt a person skilled in the art to combine the viscosity values and the quantitative composition, and document D4 does not suggest a selection of particular components, claims 1 and 2 also involve an inventive step.

6 Industrial applicability is clearly established.
